

Figure 1: Kirkland Lake West Project Location

Figure 2: Longitudinal section (looking north) of the Macassa Mine, adapted from Agnico Eagle's public disclosure of year-end 2024 mineral reserves and resources, with the Kirkland West boundary, Baldwin shaft and projected location of BAL21-024 added by Stardust. The "Projected Western Continuation" is Stardust's interpretation and is untested. Mineralization at Macassa is not necessarily indicative of mineralization on Kirkland West.

50 years ago MAY, 1938 LUCKY-KIRKLAND HAS GOOD HOLE

POSTED BY: NORTHERN MINER STAFF MAY 2, 1988

Excellent values have been secured in the No. 6 drill hole at the former property of Baldwin Kirkland, now operated by Lucky-Kirkland Gold Mines, S. L. Macdonald tells The Northern Miner.

The drill cut 11 ft of vein material at a vertical depth of about 230 ft and beyond the faulted zone which cut off the values going east on the 300-ft level. Spectacular free gold was noted in a 9-ft section of the core and an assay of \$2,118.90 was secured at this point. Reprinted from The Northern Miner, May, 1938.
